### Italy: time for the ECB to show its hand

**We are approaching the point where the ECB has to show its hand and accept its role as a lender of last resort.** Yet, the question is how much further turmoil is required for it to do so.

Italy is the linchpin of the Euro-crisis: it accounts for 17% of European GDP, 7% of Germany exports directly and 25% of Euro-area government bonds outstanding. Without Italy, we believe, there is no Euro. If Italy were (somehow) to leave the Euro, the other members of peripheral Europe would be forced to leave as well, given the degree of competitive devaluation.

#### We have the following main conclusions:

- Italian bond yields need to be below 6%-6.5% for the funding arithmetic to be sustainable. If the Italian parliament passes the austerity measures (as seems near certain) this week-end and then forms a technocratic government enjoying wide-spread support with no elections until summer (a scenario that has a 60% probability, in our view), this, together with some help from the ECB, should help BTP yields to fall to 6%. Yet, there is clearly a lot room for political slippage.
- If BTP yields stay at current levels, the ECB has to significantly step up its purchases of Italian government debt. Yet, it is unlikely to do so if Italy refuses to implement the agreed austerity measures. These are almost certain to pass, in our view. However, if they did not, we would really struggle to see how the Euro survives in its current form. We would then start to get into our "What if"-scenario (-5% GDP, 800 on the S&P500 – see our report *The Euro: what if?*, September 23).
- The moment the ECB starts to act as a genuine lender of last resort, we effectively get open-ended QE (even if the ECB is not printing money). In time, this would lead to QE3 in the US (owing to dollar strength) – and thus the end game: more printing and negative real 10-year bond yields, which would greatly alleviate government debt burdens, drive down savings ratios, reduce the cost of capital and push investors into risk assets.
- The ECB may decide to postpone strong action until Italy's 25 point plan is passed (which we think will happen this weekend). Yet, we believe that ultimately the ECB will be forced to move (not least because of its vested interest, given that it owns/repos around €600bn, as well as the fact that the ECB looks like it is being increasingly controlled by the periphery). Yet, the ECB would likely insist that the governments whose debt markets it supports are committed to meeting their fiscal targets. The only weapon it has to ensure compliance is its allowing bond yields to rise and thus the threat of a funding crisis.

As a result, investors should be aware that the Firm may have a conflict of interest that could affect the objectivity of this report. Investors should consider this report as only a single factor in making their investment decision.

... continued from the front page

- There is widespread political support for austerity in Italy (though different parties disagree on the specifics on pension reform, labour market reform and de-regulation). We suspect that opposition parties will tone down their objections to specific proposals once it looks like they are going to get in power, as was the case in Greece and Ireland.
- There are only two long term solutions to the situation in peripheral Europe: growth (via a weaker Euro in the short term, higher productivity in the long-term) or the mutualisation of debt (via Eurobonds or ECB buying – yet, in the short term, the ECB is the only practical option).
- Italy in many ways is a liquidity problem that only threatens to be a solvency problem if: a) cost of funding is too high (i.e., BTP yields stay above 6%-6.5%); or b) there is no growth (because the ECB is not expanding its balance sheet, the Euro remains too strong and productivity is structurally low). Of course, this becomes a circular argument in both directions. We believe Italy's fundamentals look better than those of Greece, Portugal or Spain.
- On the negative side, the more policy makers in core Europe talk about the possibility of a country leaving the Euro (following Sarkozy's remarks on Greece last week and leaks on Reuters overnight), the greater the possibility of a default. This is because the deposit flight is likely to accelerate (there are still €187bn of deposits with Greek banks). Either this has to be offset by the ECB repoing more domestic bonds (thereby mutualising the debt) or loans in the periphery have to fall a lot further (leading to unsustainable deflation and default).
- Continental Europe looks set to enter a recession, which is likely to get worse on the back of fiscal tightening of at least 1.2% of GDP next year, banks' probably reducing RWA by €1tn as well as the need for wages in Spain and Italy to fall by 5% to 10%. Clearly, the current government funding crisis in the periphery will only add to the negative economic momentum. Consequently, we believe the euro is likely to weaken to around €/\$1.20, with the downward pressure reinforced by the ECB eventually having to expand its balance sheet (yet, we note that our FX strategists hold a more positive view on the euro, with a 12-month target of €/\$1.52);
- We stay underweight of Continental Europe (it is not yet cheap enough) and of cyclicals (see our note *Cyclicals: stay cautious; buy US exposure*, Nov 9). Yet, we remain benchmark equities (owing to the pick-up in economic momentum in the US and emerging markets, the rise in global excess liquidity as well as attractive valuations relative to bonds).

We look into these points in more detail.

#### **The Greek debacle reminded investors of four key points:**

- The threatened referendum showed that Euro exit could really occur, especially with Sarkozy saying that "the question is whether Greece remains in the Euro-zone, that is what we want. But it is up to the Greek people to answer that question" (FT, November 3rd). We note the news reports on Reuters of Germany and France discussing a smaller Euro-area.
- 17 national governments in the Euro-area are involved in negotiations (27 in the EU – and most of the relevant required treaty changes will affect EU treaties), as well as over 100 political parties.

- It is dangerous to assume politicians act rationally.
- Larger PSI haircuts are required to bring government debt to GDP down to sustainable levels – we estimate a 84% haircut on privately held debt is required, assuming the ECB, Eurozone loans and the IMF do not take any losses.

**We believe markets are a bit unfair on Italy.** Italy has six main advantages over the rest of the periphery, which lead us to believe that Italy is more a liquidity than a solvency problem:

- It has a primary budget surplus of c1% of GDP.
- It has very low total leverage in Europe (254% of GDP, compared to 273% for the Euro-area overall). There was no private sector debt or mortgage boom.
- The average maturity of its public debt is 7.3 years, with half of the debt being owned domestically.
- Its bank sector's loan to deposit ratio is lower than that of the rest of Europe (c120% excluding retail bonds). Partly as a result of this, its borrowing from the ECB, at 7% of GDP, are still pretty small (cf to 45% of GDP for Greece).
- Italy has high private wealth to government debt ratios (5.3X), which means taxing wealth is a more effective way of reducing the debt.
- Italy has the very little net foreign debt (21% of GDP) – and thus even in a worst-case scenario of leaving the Euro, there is less need to default.

The problem is that at a certain level of bond yield, any country is insolvent. With a bond yield at 7%, a government debt to GDP ratio of 120% and trend nominal growth of 1% (0.5% real growth plus 0.5% inflation), a primary budget surplus of 7% of GDP would be required to stabilize the government debt to GDP ratio (on current policies, Italy will have a primary budget surplus of 5% in 2014, so that is not enough). Italy's net interest expense is currently 4½% of GDP, because a lot of the historic debt is on lower rates than those current prevailing in the market. We note that when Greek, Irish and Portuguese bond yields rose above 7% and LCH Clearnet raised margins requirements, all three countries received a Euro bail-out within two months.

**If growth slows even further, Italy risks becoming a solvency problem.** So, for Italy to be put on a sustainable footing, bond yields need to be lower (below 6% - 6.5% would work) and growth stronger. How can lower bond yields be achieved? One important step would be for there to be a technocratic government with broad support that commits to implementing the agreed austerity measures. We think the probability of this happening is around 60%. Secondly, the ECB has to step up its purchases aggressively to drive down BTP yields and to allow the Euro to weaken (each 10% off the Euro adds 0.7% to GDP growth). Importantly, Italy has to de-regulate its economy, with its productivity per capita 20% below German levels and it ranking 87th on the World Banks' Ease of Doing Business ranking (behind Mongolia, the Bahamas and Zambia!). We continue to believe that there has been a clear loss of competitiveness in Italy: we know that its export market share has been stable, but we still believe that only a loss of competitiveness can explain why the current account deficit is an elevated 4% of GDP, in spite of the fact that GDP growth has been 0.2% pa since 2002. The way to address low competitiveness is via a weakening Euro, de-regulation and a fall in Italian wages of up to 10%.

**What if BTP 10 year yield stay at current levels for a prolonged period?** In this case, there is likely going to be a negative spiral of events (more deflation, a greater

deterioration in credit quality, potentially France being downgraded as growth disappoints). Clearly, in that case deposit flight out of peripheral Europe will accelerate (after all, there are still €187bn of deposits left in Greek banks). If the ECB refuses to make up for this via repoing bonds or the ELA (emergency lending by the national central banks against low quality collateral), there is likely to be a massive contraction in loans in peripheral Europe that could easily end up forcing a default. Recall, Spanish banks still have loan to deposit ratio of 140%, while that of Greek banks stands at 125% (with deposit flight of 20% YTD). In effect, if the ECB were not to step up its bond purchases or repo operations soon, we believe the break up of the euro becomes a distinct possibility, creating widespread panic in financial markets and GDP falling by c5% in Europe (see our report *The Euro: what if?* 23 September). We note that after the Argentine default in 2001, there was a deposit freeze for a year.

We believe the ECB may postpone its purchases until the Italian parliament approves the latest 25-point plan. The lower chamber votes on Friday and the upper chamber on Saturday (brought forward from November 18th). Most of the details of the 25 plan have now been agreed. These are largely about de-regulation, labour market reform and removing red tape – rather than fiscal austerity. The 25-point plan is almost certain to pass (even if the Democratic Party will likely vote against it). The most likely outcome, in our view, is a technocratic government led by Amato and Monti (recently made a Senator for life), benefiting from widespread support and focused on the implementation of austerity measures and the new electoral law. Yet, we can only put a 60%-70% probability on this. The risk is that Lega Nord and Berlusconi's PDL have rejected the idea so far. Yet, some MPs of both parties appear to be in favour, as well as a large part of the opposition. If there is no majority for an emergency government, fresh elections will be called in January/February with the centre-left coalition (Social Democrats and progressive Christian Democrats) likely to win a majority (they have a 10%-12% lead over the centre right on the latest polls). Currently, the centre left coalition is divided on many key issues, which contributes to the on-going uncertainty.

However, amid all the gloom, we should not forget two key conclusions on politics:

- All parties have agreed in principle on fiscal austerity – it is just a debate about how to implement it
- There has been disagreement about de-regulation and pension reform – but in all probability the threat of a funding crisis will, as in Ireland and Greece, lead to the opposition parties toning down their policies.

**What is needed to stabilise the Euro situation on a permanent basis?** We continue to believe that the adjustments are not complete in peripheral Europe until there is at least a balanced current account (versus a deficit of 9% of GDP in Portugal & Greece and of c4% of GDP in Spain and Italy). One way or another this requires a contraction in domestic demand (i.e falling wages) in Spain and Italy. So far Italian and Spanish wages have yet to start falling. Remember how much pain has occurred in the economies that have adjusted: Irish public sector pay fell 20%, nominal GDP by 20%, Latvia had GDP falling by 25% to stay in the Euro, while public sector wages fell by 30% and the population fell 10%!). Ireland is the only peripheral European country that is running a current account surplus at the moment!

We note that once we adjust for the cost to the public sector of reducing excess private sector leverage (with private sector leverage standing at 230% of GDP in Spain and Portugal), government debt to GDP will end up close to 100% in Spain and 140% in Portugal.

**The long term solution to the Euro, we believe, is either to have growth or to mutualise the debt** (via a Eurobond or the ECB buying peripheral European bonds).

- *Growth*: Euro-area PMIs are consistent with a recession. This, as things currently stand, will get worse on the back of fiscal tightening of 1.2% of GDP next year (which is likely to rise further), RWA of banks falling by at least €1trn and the need for wages to fall in the periphery (which accounts for a third of Euro-area GDP). Therefore, we believe that the only practical solution to get growth is de-regulation (but that takes time) or a much weaker Euro. But this requires the ECB to expand its balance sheet.
- *The mutualisation of debt*: The Eurobond solution is impractical (it takes too long, is too political). Therefore the only solution to achieve the mutualisation of debt is the ECB. If the ECB buys more peripheral government bonds and then suffers losses on these purchases, it will have to be recapitalized by core Europe (in passing, the ECB has a balance sheet of €2trn, compared to total loss absorbing capital of €408bn on our calculations). Another way for the ECB to mutualise its debt is by increasing its repo operations with peripheral Europe. It already repos €420bn of bonds with peripheral Europe. This could easily increase to c€800bn as deposit flight increases. The critical issue is that the collateral posted is too small and thus increasing the repo operations is just an indirect way of core Europe bailing out the periphery. Consequently, the ongoing deposit flight, which requires the ECB to increase its exposure to peripheral Europe, will raise the stakes in this game!

**Will the ECB move?** We believe the answer is yes. Yet, it is important to note that the ECB is caught in a trap. On the one hand, it can't come out with a bazooka statement otherwise core Europe will (correctly) assume that their currency is being debased and that they risk footing the bill (via an ECB recap). On the other hand, the ECB has to convince markets it will act as a lender of last resort. Therefore, Draghi's policy of "constructive obscurity" will have to be pushed to further extremes: the ECB has to act as a lender of last resort (and has to convince the market that it accepts this role), without it explicitly saying that this is what it is doing.

**We believe that the ECB will become more aggressive because:**

- There is no practical alternative;
- It's quite possible that the Bundesbank vote (5 out of the 23 ECB Governing Council members vote with the Bundesbank) is being outnumbered by the periphery (8 members directly, rising to 10 if we include Malta and Cyprus). Hence, the resignation of Stark and last week's surprise rate cut;
- Draghi is an academic – and they tend to be more aggressive than career central bankers;
- The ECB already have a €600bn exposure to peripheral Europe and thus it is in their vested interest to 'protect' that exposure;
- Without ECB action, Europe is clearly about to enter a big recession (leaving inflation way below target!).

We take it as a positive sign that the ECB has been willing to lend via the ELA (where effectively a bank issues a bond guaranteed by the government, which is then used as collateral against which banks can borrow from their national central bank, even though such bonds would not be eligible collateral for repo operations with the ECB).

Most importantly of all, we believe that core Europe will continue to be committed to supporting the Euro. The most critical reason is that core Europe via its banks holdings in the periphery and via its liabilities to the ECB (both repos and bonds) owns €1.8trn of peripheral European assets. With net foreign liabilities at c100% of GDP in the periphery (ex Italy), the direct losses of a Euro break up (including Italy) will at least €590bn, on our estimates, with the indirect costs from the ensuing logistical nightmare of breaking up the currency union, surging core European currencies, trade wars, etc., many times higher. Just writing out a cheque in worst-case circumstances to get 2014E government debt to GDP in the periphery down to 100% (including Italy) would cost €560bn, on our estimates.

Ultimately, there has to be more pain. William Porter, head of our credit team, puts this very simply: Without the Euro, the currencies in the periphery would have fallen by a third and they represent a third of Euro-area GDP, thus there needs to be a 10% 'loss' of GDP (which incidentally is almost in line with the average cost of a banking crisis). The only other way of getting this 'loss' would be a for a 10% weaker Euro, but again that would require the ECB to expand its balance sheet.

**What short term measures outside of the ECB control can be taken?** Almost none. The IMF only have about €300bn of funded capital, which is not enough. The EFSF has only €200bn of funding if Italy and Spain are excluded. If there is no mutualisation of debt via the ECB or a Eurobond solution, the only short term solution we believe would be a €1trn EFSF (the maximum size possible before the contingent liabilities incurred by core Europe lead to a French downgrade). Of this, €200bn could be used to recap banks, €300bn lent to national governments to buy in debt at market prices and the rest leveraged via the EFSF.

#### **What are the investment conclusions?**

- If the ECB does not act, the likelihood of a Euro break up increases, which, we estimate, will entail a 5% fall in European GDP and will lead the S&P 500 to fall to 800.
- Yet, we believe the ECB will eventually end up with a more open ended commitment to buy peripheral European debt (buying BTPs off French banks/insurance and raising deposits to pay for them). However, it will probably take further turmoil to achieve this. Once the ECB acts as lender of last resort, its balance sheet expands and the quality of its balance sheet deteriorates, leading to a fall in the euro. The weaker euro, in turn, makes QE3 in the US much more likely, in a way that four major central banks would be printing money (the Fed, the BoE, the BoJ and SNB) and one de facto expanding its balance sheet (the ECB). In due course, investors would seek the cheap inflation hedge of equities.
- We stay benchmark equities, on the back of the improvement in US macro momentum, excess liquidity and attractive valuations relative to bonds. Our end-2011 S&P 500 target is 1,270 and 1,340 for end-2012.
- We stay underweight Continental Europe: it is not yet cheap enough to compensate for all the risks it is facing. The P/E ratio is just below its norm, as is the sector-adjusted P/B. Only the utility and leisure sectors are more than one standard deviation relative to their US peers;
- As stated above, we think the probability of a positive political outcome in Italy, at around 60%, is high (bond yields falling as a technocratic government, enjoying widespread support, implements the agreed austerity measures). Yet, it is not high enough to us to invest in risk trades associated with Italy.

- We continue to believe that a Euro break-up has a small probability – and within Europe, we think that the best risk trades are the DAX (the third cheapest market), domestic Germany (which looks set to have an interest rate, currency and above all Bund yields all much lower than it deserves) and EuroStoxx dividend futures that are discounting a decline of 35% to 2015.
- We stay underweight of cyclicals: in our note yesterday (*Cyclicals: stay cautious; buy US exposure*, Nov 9), we downgraded advertising to underweight and reiterated our underweights of capital goods, retailing and hotels. However, we like cyclicals with high US exposure.

## Disclosure Appendix

### Important Global Disclosures

The analysts identified in this report each certify, with respect to the companies or securities that the individual analyzes, that (1) the views expressed in this report accurately reflect his or her personal views about all of the subject companies and securities and (2) no part of his or her compensation was, is or will be directly or indirectly related to the specific recommendations or views expressed in this report.

The analyst(s) responsible for preparing this research report received compensation that is based upon various factors including Credit Suisse's total revenues, a portion of which are generated by Credit Suisse's investment banking activities.

#### Analysts' stock ratings are defined as follows:

**Outperform (O):** The stock's total return is expected to outperform the relevant benchmark\* by at least 10-15% (or more, depending on perceived risk) over the next 12 months.

**Neutral (N):** The stock's total return is expected to be in line with the relevant benchmark\* (range of  $\pm 10-15\%$ ) over the next 12 months.

**Underperform (U):** The stock's total return is expected to underperform the relevant benchmark\* by 10-15% or more over the next 12 months.

*\*Relevant benchmark by region: As of 29<sup>th</sup> May 2009, Australia, New Zealand, U.S. and Canadian ratings are based on (1) a stock's absolute total return potential to its current share price and (2) the relative attractiveness of a stock's total return potential within an analyst's coverage universe\*\*, with Outperforms representing the most attractive, Neutrals the less attractive, and Underperforms the least attractive investment opportunities. Some U.S. and Canadian ratings may fall outside the absolute total return ranges defined above, depending on market conditions and industry factors. For Latin American, Japanese, and non-Japan Asia stocks, ratings are based on a stock's total return relative to the average total return of the relevant country or regional benchmark; for European stocks, ratings are based on a stock's total return relative to the analyst's coverage universe\*\*. For Australian and New Zealand stocks, 12-month rolling yield is incorporated in the absolute total return calculation and a 15% and a 7.5% threshold replace the 10-15% level in the Outperform and Underperform stock rating definitions, respectively. The 15% and 7.5% thresholds replace the +10-15% and -10-15% levels in the Neutral stock rating definition, respectively.*

*\*\*An analyst's coverage universe consists of all companies covered by the analyst within the relevant sector.*

**Restricted (R):** In certain circumstances, Credit Suisse policy and/or applicable law and regulations preclude certain types of communications, including an investment recommendation, during the course of Credit Suisse's engagement in an investment banking transaction and in certain other circumstances.

**Volatility Indicator [V]:** A stock is defined as volatile if the stock price has moved up or down by 20% or more in a month in at least 8 of the past 24 months or the analyst expects significant volatility going forward.

#### Analysts' coverage universe weightings are distinct from analysts' stock ratings and are based on the expected performance of an analyst's coverage universe\* versus the relevant broad market benchmark\*\*:

**Overweight:** Industry expected to outperform the relevant broad market benchmark over the next 12 months.

**Market Weight:** Industry expected to perform in-line with the relevant broad market benchmark over the next 12 months.

**Underweight:** Industry expected to underperform the relevant broad market benchmark over the next 12 months.

*\*An analyst's coverage universe consists of all companies covered by the analyst within the relevant sector.*

*\*\*The broad market benchmark is based on the expected return of the local market index (e.g., the S&P 500 in the U.S.) over the next 12 months.*

#### Credit Suisse's distribution of stock ratings (and banking clients) is:

	Global Ratings Distribution	
Outperform/Buy*	48%	(62% banking clients)
Neutral/Hold*	40%	(56% banking clients)
Underperform/Sell*	10%	(53% banking clients)
Restricted	2%	

*\*For purposes of the NYSE and NASD ratings distribution disclosure requirements, our stock ratings of Outperform, Neutral, and Underperform most closely correspond to Buy, Hold, and Sell, respectively; however, the meanings are not the same, as our stock ratings are determined on a relative basis. (Please refer to definitions above.) An investor's decision to buy or sell a security should be based on investment objectives, current holdings, and other individual factors.*

Credit Suisse's policy is to update research reports as it deems appropriate, based on developments with the subject company, the sector or the market that may have a material impact on the research views or opinions stated herein.

### Important Credit Suisse HOLT Disclosures

With respect to the analysis in this report based on the Credit Suisse HOLT methodology, Credit Suisse certifies that (1) the views expressed in this report accurately reflect the Credit Suisse HOLT methodology and (2) no part of the Firm's compensation was, is, or will be directly related to the specific views disclosed in this report.

The Credit Suisse HOLT methodology does not assign ratings to a security. It is an analytical tool that involves use of a set of proprietary quantitative algorithms and warranted value calculations, collectively called the Credit Suisse HOLT valuation model, that are consistently applied to all the companies included in its database. Third-party data (including consensus earnings estimates) are systematically translated into a number of default variables and incorporated into the algorithms available in the Credit Suisse HOLT valuation model. The source financial statement, pricing, and earnings data provided by outside data vendors are subject to quality control and may also be adjusted to more closely measure the underlying economics of firm performance. These adjustments provide consistency when analyzing a single company across time, or analyzing multiple companies across industries or national borders. The default scenario that is produced by the Credit Suisse HOLT valuation model establishes the baseline valuation for a security, and a user then may adjust the default variables to produce alternative scenarios, any of which could occur. Additional information about the Credit Suisse HOLT methodology is available on request.

The Credit Suisse HOLT methodology does not assign a price target to a security. The default scenario that is produced by the Credit Suisse HOLT valuation model establishes a warranted price for a security, and as the third-party data are updated, the warranted price may also change. The default variables may also be adjusted to produce alternative warranted prices, any of which could occur.

CFROI®, HOLT, HOLTfolio, HOLTselect, ValueSearch, AggreGator, Signal Flag and "Powered by HOLT" are trademarks or service marks or registered trademarks or registered service marks of Credit Suisse or its affiliates in the United States and other countries. HOLT is a corporate performance and valuation advisory service of Credit Suisse.

Additional information about the Credit Suisse HOLT methodology is available on request.

This report is not directed to, or intended for distribution to or use by, any person or entity who is a citizen or resident of or located in any locality, state, country or other jurisdiction where such distribution, publication, availability or use would be contrary to law or regulation or which would subject Credit Suisse AG, the Swiss bank, or its subsidiaries or its affiliates ("CS") to any registration or licensing requirement within such jurisdiction. All material presented in this report, unless specifically indicated otherwise, is under copyright to CS. None of the material, nor its content, nor any copy of it, may be altered in any way, transmitted to, copied or distributed to any other party, without the prior express written permission of CS. All trademarks, service marks and logos used in this report are trademarks or service marks or registered trademarks or service marks of CS or its affiliates.

The information, tools and material presented in this report are provided to you for information purposes only and are not to be used or considered as an offer or the solicitation of an offer to sell or to buy or subscribe for securities or other financial instruments. CS may not have taken any steps to ensure that the securities referred to in this report are suitable for any particular investor. CS will not treat recipients as its customers by virtue of their receiving the report. The investments or services contained or referred to in this report may not be suitable for you and it is recommended that you consult an independent investment advisor if you are in doubt about such investments or investment services. Nothing in this report constitutes investment, legal, accounting or tax advice or a representation that any investment or strategy is suitable or appropriate to your individual circumstances or otherwise constitutes a personal recommendation to you. CS does not offer advice on the tax consequences of investment and you are advised to contact an independent tax adviser. Please note in particular that the bases and levels of taxation may change.

CS believes the information and opinions in the Disclosure Appendix of this report are accurate and complete. Information and opinions presented in the other sections of the report were obtained or derived from sources CS believes are reliable, but CS makes no representations as to their accuracy or completeness. Additional information is available upon request. CS accepts no liability for loss arising from the use of the material presented in this report, except that this exclusion of liability does not apply to the extent that liability arises under specific statutes or regulations applicable to CS. This report is not to be relied upon in substitution for the exercise of independent judgment. CS may have issued, and may in the future issue, a trading call regarding this security. Trading calls are short term trading opportunities based on market events and catalysts, while stock ratings reflect investment recommendations based on expected total return over a 12-month period as defined in the disclosure section. Because trading calls and stock ratings reflect different assumptions and analytical methods, trading calls may differ directionally from the stock rating. In addition, CS may have issued, and may in the future issue, other reports that are inconsistent with, and reach different conclusions from, the information presented in this report. Those reports reflect the different assumptions, views and analytical methods of the analysts who prepared them and CS is under no obligation to ensure that such other reports are brought to the attention of any recipient of this report. CS is involved in many businesses that relate to companies mentioned in this report. These businesses include specialized trading, risk arbitrage, market making, and other proprietary trading.

Past performance should not be taken as an indication or guarantee of future performance, and no representation or warranty, express or implied, is made regarding future performance. Information, opinions and estimates contained in this report reflect a judgement at its original date of publication by CS and are subject to change without notice. The price, value of and income from any of the securities or financial instruments mentioned in this report can fall as well as rise. The value of securities and financial instruments is subject to exchange rate fluctuation that may have a positive or adverse effect on the price or income of such securities or financial instruments. Investors in securities such as ADR's, the values of which are influenced by currency volatility, effectively assume this risk.

Structured securities are complex instruments, typically involve a high degree of risk and are intended for sale only to sophisticated investors who are capable of understanding and assuming the risks involved. The market value of any structured security may be affected by changes in economic, financial and political factors (including, but not limited to, spot and forward interest and exchange rates), time to maturity, market conditions and volatility, and the credit quality of any issuer or reference issuer. Any investor interested in purchasing a structured product should conduct their own investigation and analysis of the product and consult with their own professional advisers as to the risks involved in making such a purchase.

Some investments discussed in this report have a high level of volatility. High volatility investments may experience sudden and large falls in their value causing losses when that investment is realised. Those losses may equal your original investment. Indeed, in the case of some investments the potential losses may exceed the amount of initial investment, in such circumstances you may be required to pay more money to support those losses. Income yields from investments may fluctuate and, in consequence, initial capital paid to make the investment may be used as part of that income yield. Some investments may not be readily realisable and it may be difficult to sell or realise those investments, similarly it may prove difficult for you to obtain reliable information about the value, or risks, to which such an investment is exposed.

This report may provide the addresses of, or contain hyperlinks to, websites. Except to the extent to which the report refers to website material of CS, CS has not reviewed the linked site and takes no responsibility for the content contained therein. Such address or hyperlink (including addresses or hyperlinks to CS's own website material) is provided solely for your convenience and information and the content of the linked site does not in any way form part of this document. Accessing such website or following such link through this report or CS's website shall be at your own risk.

This report is issued and distributed in Europe (except Switzerland) by Credit Suisse Securities (Europe) Limited, One Cabot Square, London E14 4QJ, England, which is regulated in the United Kingdom by The Financial Services Authority ("FSA"). In jurisdictions where CS is not already registered or licensed to trade in securities, transactions will only be effected in accordance with applicable securities legislation, which will vary from jurisdiction to jurisdiction and may require that the trade be made in accordance with applicable exemptions from registration or licensing requirements. Non-U.S. customers wishing to effect a transaction should contact a CS entity in their local jurisdiction unless governing law permits otherwise. U.S. customers wishing to effect a transaction should do so only by contacting a representative at Credit Suisse Securities (USA) LLC in the U.S.

Please note that this report was originally prepared and issued by CS for distribution to their market professional and institutional investor customers. Recipients who are not market professional or institutional investor customers of CS should seek the advice of their independent financial advisor prior to taking any investment decision based on this report or for any necessary explanation of its contents. This research may relate to investments or services of a person outside of the UK or to other matters which are not regulated by the FSA or in respect of which the protections of the FSA for private customers and/or the UK compensation scheme may not be available, and further details as to where this may be the case are available upon request in respect of this report.

Any Nielsen Media Research material contained in this report represents Nielsen Media Research's estimates and does not represent facts. NMR has neither reviewed nor approved this report and/or any of the statements made herein.

If this report is being distributed by a financial institution other than Credit Suisse AG, or its affiliates, that financial institution is solely responsible for distribution. Clients of that institution should contact that institution to effect a transaction in the securities mentioned in this report or require further information. This report does not constitute investment advice by Credit Suisse to the clients of the distributing financial institution, and neither Credit Suisse AG, its affiliates, and their respective officers, directors and employees accept any liability whatsoever for any direct or consequential loss arising from their use of this report or its content.
